

Develop a Mobile App (for learning about IIIT-Delhi)

Task:

Develop a basic mobile learning app:

0. User is presented with a choice of Hindi or English. User selects one and then the entire UI is in that language.
1. When the user opens the app, she is presented with a list of topics (clickable buttons).
 - What is IIIT
 - Which programs are available
 - How to take admission at UG level
2. When she clicks any button, she is presented with some text (use the text from the website - make it concise and meaningful instead of just copying entire thing). Text length should be such that it is more than one mobile screen but not too much.
3. A user should be able to go from any topic to any topic (either via a home screen or any other route)
4. The app should be developed such that you can convert it to learning anything i.e. the data should be easily replacable.
